

Our niche: Blowing with compressed air

Safety air guns can be found everywhere in any production facility and they are the product that most often springs to mind when talking about blowing with compressed air.

Blowing with compressed air

Safety air guns are used primarily for cleaning tools, machinery and parts as well as floors and complete workplaces etc. Blowing with compressed air is used also to dry, cool, sort and transport parts and tools in production. A conventional open pipe with a drilled hole or nozzle suitable for fluids is commonly used in such applications. Technical design calculations are seldom carried out, which in principle means that every application is over-dimensioned.

FIELDS OF APPLICATION

- Cleaning
- Drying
- Cooling
- Transporting
- Sorting
